**ULB**

## **Change detection for updates of vector database through region-based classification of VHR satellite data**

**Institut de Gestion de l'Environnement et d'Aménagement du Territoire**

**A.P. Carleer**, researcher, ULB

**E. Wolff**, G.I.S. and Remote Sensing Professor at the ULB

# ORFEO accompaniment program

# Outline

- **Introduction**
- **Objective**
- **Study zone and data**
- **Method**
- **Results**
- **Conclusions**

# The local geospatial databases need to be update

- **Interpretation of aerial photographs**
  - expensive and time-consuming task
- **VHR satellite data (QuickBird, Ikonos, Pleiades HR data)**
  - advantage of the satellite images
    - digital format
    - large spatial coverage
    - multispectral mode
    - ...
  - very high spatial resolution

## Change detection methods

- **Image – Database change detection**
- **Image – Image change detection**
  - **change – no change detection**
  - **categorical change detection**

→ **VHR supervised classification**

→ **Two occurring problems with VHR data pixel-based classification**

- **spectral variability**
- **poor spectral resolution**

# Spectral variability and spectral problems

- Decreases the spectral separability in the spectral space
- Causes salt and pepper effect

**SPOT 5, 2004**

**IKONOS, 2004**

**To overcome these problems, a region-based classification can be used**

**Segmentation**

**Classification**

## **Advantages of the segmentation**

- **Avoids the “salt-and-pepper” effect**
- **Allows the use for a lot of features on top of spectral features**
  - **Textural features (without arbitrary neighbors)**
  - **Morphological features (shape, length, width,...)**
  - **Contextual features**

## Objective of the project

**Study the potential of the Pleiades-HR data to detect change for updates of vector database through region-based classification**

## Research network

**Royal Military Academy,  
Signal and Image Centre**

**University of Liège,  
Space Centre of Liège**

**ULB**

## End users

- **Belgian National Geographical Institute**  
**1/10000 topographic map (TOP10v-GIS)**

### **Ambitious database updating policy**

- **Road network each year**
- **Buildings each three years**
- **Complete database each six years**

**→ Need of new update procedure**

# Selection of the study area and data collection

Data	Acquisition date	Scale	Spatial resolution (m)	OFF-nadir
QB Pan	12 May 2004		0.65	13°
QB XS	12 May 2004		2.58	13°
QB Pan	13 Sept. 2006		0.7	22°
QB XS	13 Sept. 2006		2.78	22°
PICC		1/1000		
I PIS	2004			
TOP10V-GIS	1999 - 2000	1/10000		

# Geocoding and orthorectification of VHR images and co-registration with databases

- **Othorectification**

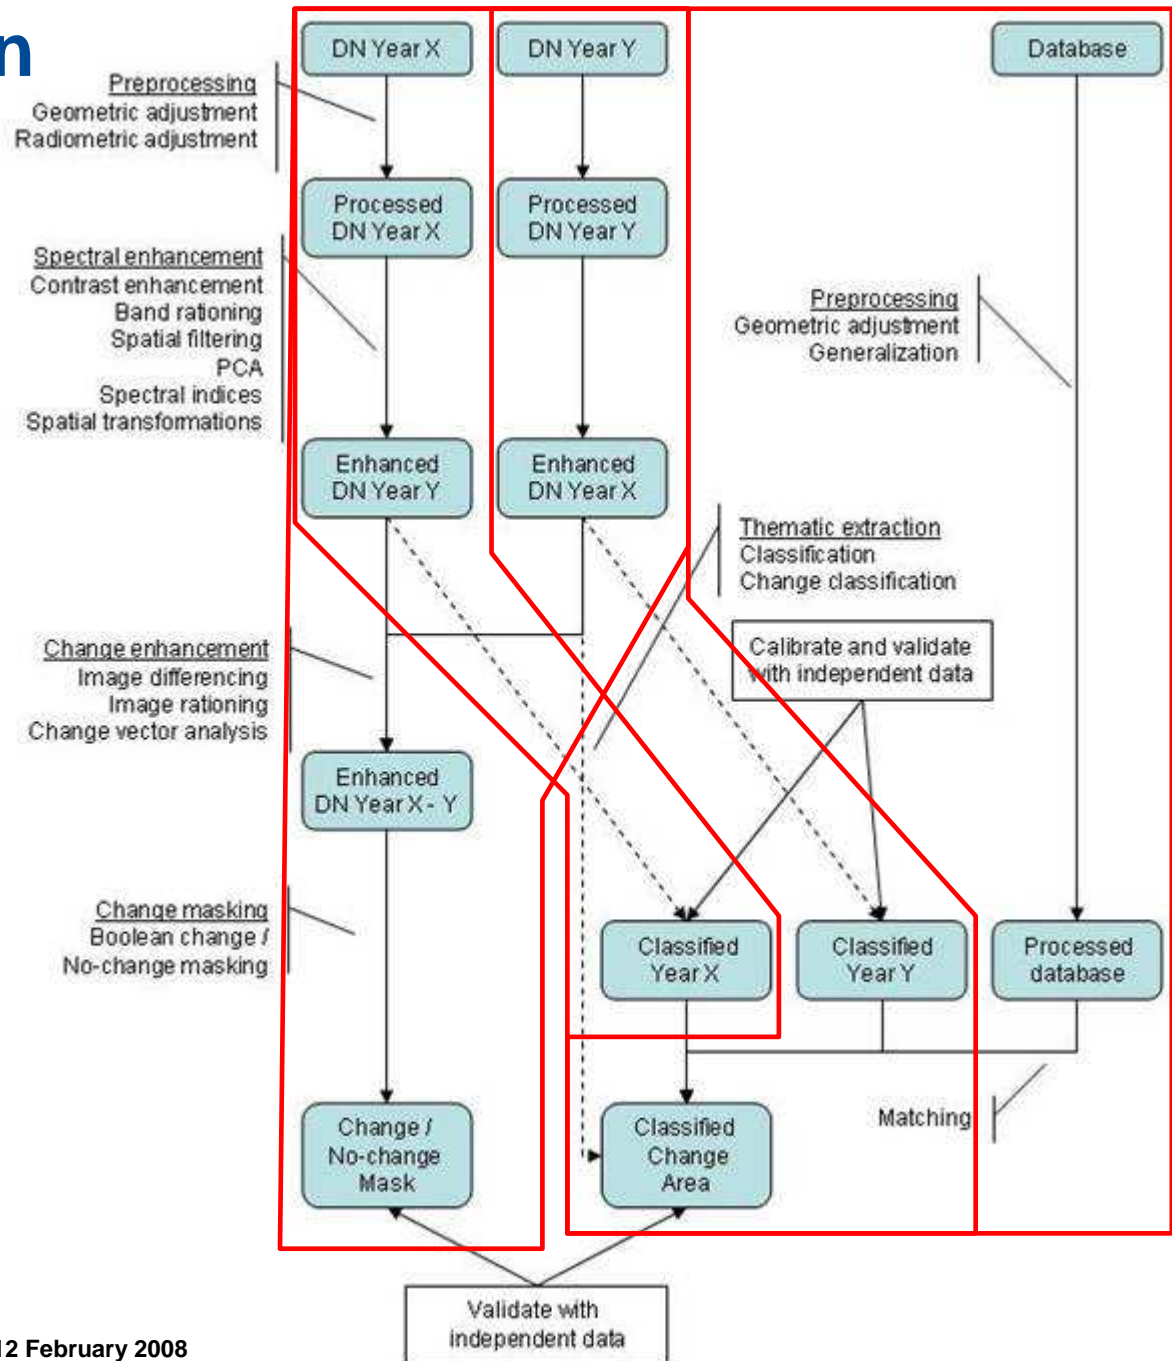

Image	Acquisition date	Nb GCP	Order	X RMSE	Y RMSE
QB Pan	12 May 2004	128	3nd	0,94	0,91
QB XS	12 May 2004	128	3nd	0,23	0,22

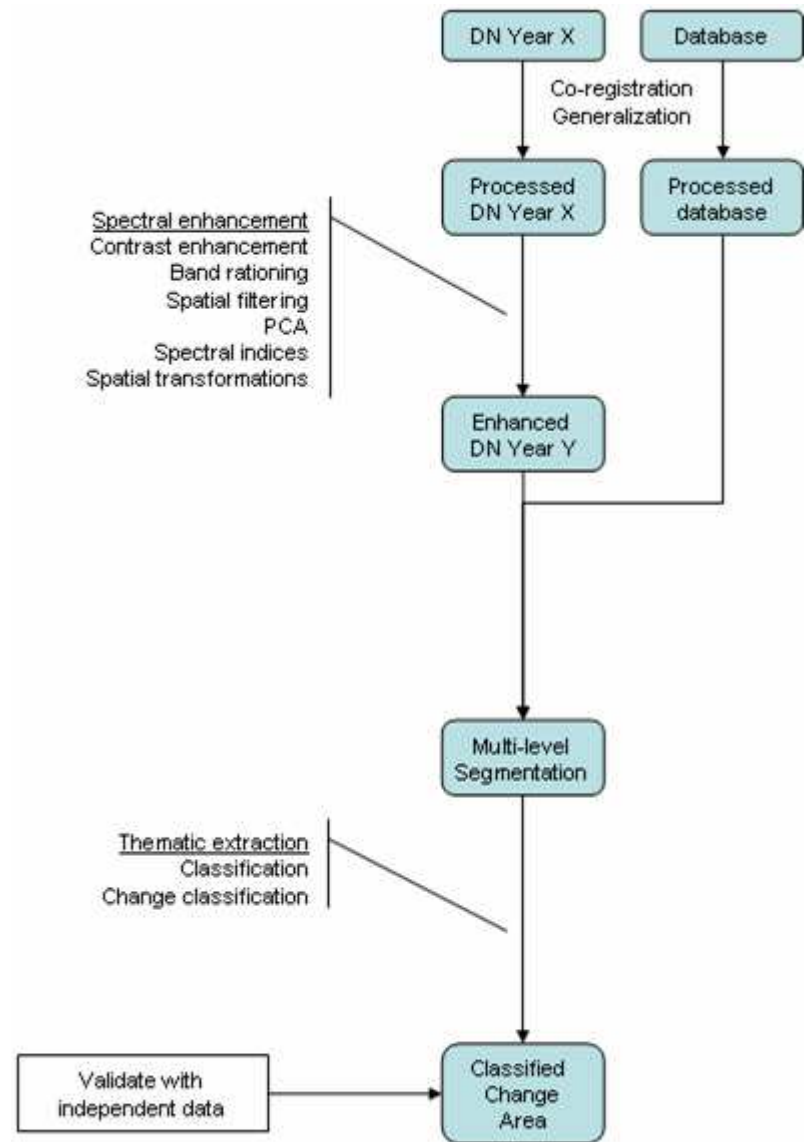

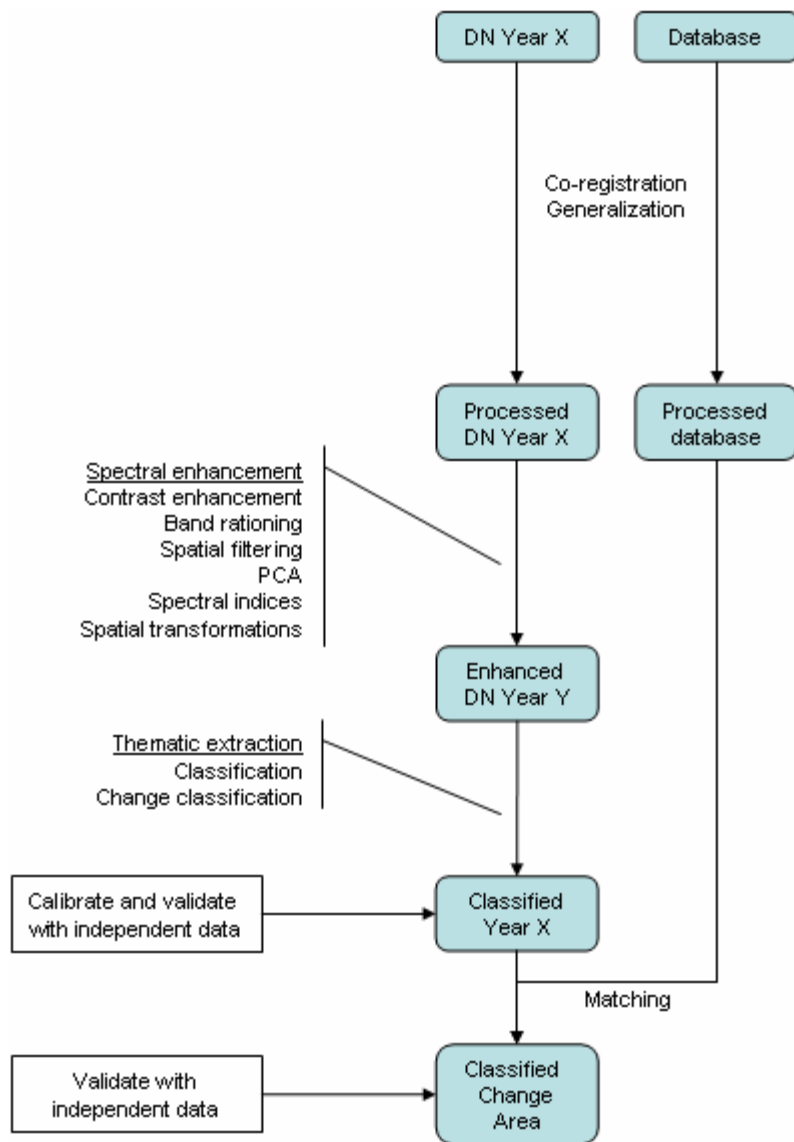

# Study zone

-  Road
-  Building
-  Vegetation
-  Water

# Change detection method

Database segmentation

Database generalization

Image segmentation

Image classification

Level 1		Level 2	
Barren surfaces	1	Barren surfaces	11
		Shadow	11
		Building	12
		Road	13
		Vegetation	14
		Water	15
Building	2	Building	22
		Shadow	22
		Barren surfaces	21
		Road	23
		Vegetation	24
		Water	25
Road	3	Road	33
		Shadow	33
		Barren surfaces	31
		Building	32
		Vegetation	34
		Water	35
Vegetation	4	Vegetation	44
		Shadow	44
		Barren surfaces	41
		Building	42
		Road	43
		Water	45
Water	5	Water	55
		Shadow	55
		Barren surfaces	51
		Building	52
		Road	53
		Vegetation	54

## Feature used for the classification

- Vegetation :

NDVI threshold

- Shadow:

panchromatic threshold

- Barren surfaces, Road, Building, Water:

Panchromatic and Red bands,

Contrast of Green and Red bands, Second angular moment of Panchromatic band,

Length / Width

# Change detection assessment

## Change error matrix

		Reference	
		No change	Change
Classification	No change	8853285	53638
	Change	3538499	514564

Change detection accuracy = **72 %**

## Transition error matrix

		Reference			
		No change	Change	No change	Change
Classification	No change	8853285	0	53638	0
	Change	3538499	254731	0	259833

Transition detection accuracy = **70 %**

Classification detects **7 times more** change than the reference but detects **90.5%** of the true changes

# Occlusion

 Occlusion of the Roads

Represents 2.4% of the false changes

# Land-use Vs Land-cover

**Some problems with the “Garden”**

# Land-use Vs Land-cover

## Some problems with the “Crop fields”

Represent **72%** of the false changes

# Conclusions

- **This study highlights some problems**
- **Good results**
- **Data integration and matching**
- **A good co-registration / orthorectification is very important**

# Perspectives

- Overcome the occlusion problems
- Overcome the class definition problems
- Test other study zones
- Try to use the other QuickBird image (22° off-nadir)

2004

2006
